Service Manual

In this manual only the differences between the VP310 and the VP380 are mentioned.

For repair and partslist the Service Manual of the VP310 must be used.

Differences in the VP380:

Chapter	Page
Technical data	2-1
Control and Connection	3-1
Partslist cabinet VP380	5-1
Blockdiagram	6-1
Wiring digrams	7-1
Multi panel diagrams	10-1
Multi panel lay-out	10-2
μ processor diagram	11-1
μ processor lay-out	11-2
Video signal path description	12-1 ÷ 12-3
Measurements and adjustments video	12-4 ÷ 12-5
Partslist video	12-6
Video panel lay-out chip side	12-7
Video schematic diagram	12-8 ÷ 12-11
Video panel lay-out component side	12-12
Analog audio panel lay out and partslist	13-1
Analog audio schematic diagram	13-2
List of F-codes commands	15-2
Additional information	15-2

(S)

Varning!

Osynlig laserstråling när denna del är öppnad och spärren är urkopplad. Betakta ej strålen.

(DK)

Advarsell

Usynlig laserstråling ved åbning når sikkerhedsafbryder er ude af funktion. Undgå udsættelse for stråling.

(SF)

Varoitus!

Laite sisältää laserdiodin, joka lähettää näkymätöntä silmille vaarallista lasersäteilyä.

(GB)

Safety regulations require that the set be restored to its original condition and that parts which are identical with those specified be used.

RS232 interface

Serial computer interface, in accordance with international communication standard EIA-232-D.
Full duplex
1200/9600 baud (selectable)
8 data bits, 1 stop bit, no parity

The drive is fitted with a 25-pole female D-type connector with following pin connections :

PIN	SIGNAL
2	(T x D) transmitted data from drive to computer
3	(R x D) received data from computer to drive
5	(CTS) clear to send : a signal from computer to drive indicating the computer is ready to receive data.
7	(GND) logic ground
20	(DTR) data terminal ready : a signal from drive to computer indicating the drive is ready to receive data.

Fault symptoms and possible causes

Drive remains in standby mode

- Check if transport locks have been removed.

Disc does not eject

- Check the REPLAY button.
- Check that the drive is connected to the mains supply and that the POWER indicator is lit.

Disc does not rotate

- Check that the drive is receiving power: the POWER indicator should be lit.
- Check that the disc-tray is properly closed.
- Check that the disc is properly loaded.

Disc rotates but picture is weak or absent

- Check the connection between monitor and drive.
- Check that the disc has been loaded correctly (label up) on the disc-tray. (Some discs have program content on one side only.)
- Press the [>] section of the SEARCH button.
- The drive is in the pause mode: Press the [>] section of the PLAY button.
- **VP380 only.**
If the sound is good but picture is poor (rolling/tearing/no colour) check that the disc being played is the expected television system standard (PAL/NTSC).

Drive sticks at particular point on disc

- Press the [>] section of the SEARCH button momentarily to skip over the affected part.
- Remove the disc and wipe both surfaces clean with a soft, dry cloth to remove possible opaque surface marks.

Special effects (still, slow, reverse, fast) do not function

- Check that a CAV disc is being played; when playing CLV discs, the special-effects buttons do not function.

Unstable still picture

- If still pictures taken from a fast moving scene sometimes flicker, this is no fault of the drive but results from the basic program material used for disc production.

Good picture but no sound

- Make sure that the drive is in its forward playing mode (in all other modes there is no sound).
- Check that the sound channels AUDIO 1 (left channel) and/or AUDIO 2 (right channel) are switched on.
- If an LV-ROM disc is being played, there may be data and therefore no sound on the disc. Try a non-LV-ROM disc.

Digit buttons are inoperative

- Check REPLAY button.
- Check whether the picture number or chapter number is displayed on the monitor. If not, press PNR or CNR.

Remote control does not function correctly

- Check batteries in remote control handset.
- If the drive is in the replay mode, most controls are disabled.
- Check mini jack plug is inserted correctly in the WIRED RC socket.

The drive fails to respond when under computer control

- Check baud rate and parity.
- Check the connections to the relevant interface.
- Ensure that DATA IN and DATA OUT are the right way around (RS232-C).
- Check that the DTR signal from the drive is being received by the computer (RS232-C).
- Check the CTS signal of the computer.
- To reset drive, switch the power off, wait ten seconds, switch power on.

Technical information

Optical discs

LaserVision/Laser Disc

Disc diameter	300 mm or 200 mm
Disc thickness	2.7 mm
Disc speed	CAV disc: 1500 r.p.m. CLV disc: 1500-570 r.p.m.

Maximum capacity	
300 mm - disc	CAV disc: 54 000 pictures per side
200 mm - disc	CAV disc: 24 000 pictures per side

Max. playing time	
300 mm - disc	CAV disc: 36 minutes per side CLV disc: 1 hour per side
200 mm - disc	CAV disc: 16 minutes per side CLV disc: 24 minutes per side

Average track pitch	1.6 - 1.8 μ m
---------------------	-------------------

Compact disc

Disc diameter	120 mm or 80 mm
Disc thickness	1.2 mm
Disc speed	600 - 200 r.p.m.

Maximum capacity	
120 mm disc	74 minutes
80 mm disc	26 minutes
Average track pitch	1.6 μ m

Drive

Front loading motor-powered disc-tray

startup time	
LV 300 mm :	\leq 20 sec
LV 200 mm :	\leq 14 sec
CD 120 mm :	\leq 10 sec
CD 80 mm :	\leq 10 sec
Clip 120 mm :	\leq 10 sec

unload time

VIDEO SIGNAL PAHT DESCRIPTION

1.1 High frequency input

The HF-AV signal enters the video panel on connector 2V11/.

The HF-A (analog audio) leaves the video panel via buffer 7312 on connector 2V17. The amplitude of the HF-AV is 400 mV at the CAV disk-inside and 800 mV at the CAV disk outside.

The video HF is then split-up in a PAL- and NTSC branch.

The PAL-branch via buffer 7315 consists of a 1,7 MHz HPF-5304 and a double notch-filter 5311-684 kHz and 5313-1066 kHz to remove the analog audio carriers.

The NTSC-branch via buffer 7316 consists of a 3,22 MHz HPF-5300 and a double notch-filter 5308-2,3 MHz and 5316-2,8 MHz to remove the analog audio carriers.

After this a LPF of 14 MHz-5314 and 5315 for both the PAL and NTSC-signal.

1.2 Modulation transfer function

The filtered HF-video signal comes at pin 7 of 7903-A. Here the MTF takes place for PAL with 5305-8 MHz and for NTSC with 5303-10 MHz. In 7903-B the MTF-corrected signal is amplified 8 dB.

1.3 Demodulation

In 7903-C the signal at pin 14 is demodulated. Between pin 18 and 23 a separate LPF for PAL and NTSC takes place. For PAL via 5317-5 MHz and for NTSC via 53123-4,2 MHz 7901 is a video switch for PAL/NTSC.

In 7903-C pin 23 deemphasis takes place for PAL and NTSC. For NTSC 3387, 2387 and 3319 are switched parallel to 3333 and 2325. The AGC control will keep the video amplitude on pin 29 at 0,85 Vpp.

1.4 Drop out correction

The next part of 7903-C is the drop-out function. Drop-outs are detected in the limiter and via block D.O.D. a DRQ (data request) on pin 17 can be blocked. The data on pin 25 is for the 24-bit or manchester decoder.

On pin 48 chroma-signal is available not time base corrected. The chroma separator can be adjusted for 3,66 MHz this is the middle of 4,43 MHz (PAL) and 3,58 MHz (NTSC) with 5310 on pin 1.

Pin 2 will provide the composite sync. signal from the disk-video.

Note : 3347, 3382 and 3381 are not mounted because the feed forward servo of the time base correction is not within specification for NTSC.

7902 is the drop-out delay line. the signal at pin 6 is notched at 4,43 MHz with 5302. At pin 7 the F72 clock for NTSC (7,1 MHz is double NTSC chroma carrier) is provided. For PAL an additional delay is needed of 0,5 μ S with 5318 and 5306 switched via 7313 and 7321 because the NTSC delay time is 36,5 μ S.

The drop-out LPF 5301-3,75 MHz is to remove the clock pulse rests. The drop-out amplitude can be adjusted with 3338 for the same amplitude as for the not drop-out signal.

1.5 Time base correction

Between pin 29 of 7903-C and pin 31 of 7903-D the time base is corrected. See chapter time base correction.

5307 removes double carrier rests with a notch of 15,5 MHz.

7904 is the time base correction delay line.

5400 is a LPF of 5,9 MHz for removing the clock pulse rests.

The time base corrected video enters the 7903-D pin 31 (Part II video schematic) first the signal is controlled for a constant DC-level with 2350, then the time fault measuring the chroma and composync. signals are removed from the video signal available on respectively pin 44 and 46. On pin 45 chroma separation filter can be adjusted with 5300 on 3,66 MHz.

1.6 Noise suppression

After the special burst suppression in 7903-D the noise suppression filter is located, this filter is only active via 7318 on high frequencies in the luminance signal. During teletext lines the noise suppression filter is switched off with the VWIN-signal (vertical window) on pin 36.

In NTSC the capacitor 2382 is switched to ground. 2382 and 2383 are switched parallel.

The half picture part in 7903-D is not used.

Before the video signal leaves the 7903-D the signal is amplified to a level of 1 Vpp.

1.7 Video processing

The DC-level after amplifier 7305, 7306 is 3,4V, the signal is split-in a video and a teletext signal line. In teletext the signal part under the black level is cut in 6811 and 6812 and delayed in 5681 with 400 ns and amplified in 7681 and 7682. In multiplexer 7902 the teletext lines are mixed with the CVBS-signal means of the TXT.WIN (TXT windows) and INT.VI (Internal video) with respect that no teletext is possible when the player is starting up. With the SDC2 signal (sand castle 2) the CVBS and TXT-CVBS are clamped on the black level.

The video signal line from C-7306 is split-up in a NTSC and PAL luminance/chrominance dividers. In the PAL divider, the lower line in the schematic diagram part II, is the same as in the VP310 also the adjustments are the same.

In the NTSC divider first the signal is delayed one time. At pin 2 of 5513 is 180° shifted to the signal on C-7511. These two signals are added to remove the sub carrier of

3,58 MHz and becomes available on e-7513, no chrominance is left here. On e-7512 only chrominance is available because the signal on 1-5513 is in phase with the signal on e-7511. Filter 5515 removes luminance rests on 3,58 MHz.

With 5514 the group delay time is corrected (minimum chrominance signal on e-7513). The flatness of the full field multi burst is adjusted with 5515 (with NTSC test disc). Filter 5516 on 3,58 MHz \pm 600 kHz is for limiting the bandwidth.

1.8 RGB decoder/encoder

The RGB multi standard decoder 7922 is adjusted for PAL in the same procedure as for the VP310 after that the specific NTSC-adjustments (HEU and 7,16 MHz loopfilter). The loopfilter on pin 24 and 25 is active for NTSC when the DC-level is low, the filter is responding on the HUE-adjustment potentiometer 3580. In NTSC the H/2 demodulator is controlled with 3559 and for PAL with 3560.

SDC1 and SDC2 (sand castle) are added to the frame pulse and feed to pin 7 of 7922.

On pin 12, 14 and 16 the characters are inserted with blanking signal on pin 9.

The RGB output of 7922 on pin 13, 15 and 17 are followed by sync. removers respectively 7601, 7602 and 7610, 7611 and 7612, 7613. After these sync. removers, the filters 5601, 5611 and 5614 will filter the double subcarrier frequency of 7,78 MHz between PAL and NTSC out.

The red and green color signals are going via potmeter 3608 and 3611 for amplitude adjustment to the encoder 7925 pin 2 and 3. the blue signal is going direct to the encoder pin 4. The encoder is functioning to the PAL standards when the Q-PAL line is high the Q-NTSC line is high on pin 7 of 7925. The Q-PAL (Quasi-PAL) will switch the 4,43 MHz subcarrier frequency from X-tall 5675 to pin 6 of 7925 when the Q-PAL signal is low. The RGB output is buffered in the IC and fed to the scart connector. The Y-output on pin 16 is going via a delay line of 270 ns to pin 18 where it is added to the chrominance signal (for PAL and NTSC) chrominance coming from pin 15 is going via a switchable filter (PAL/NTSC) to the encoder pin 17.

On pin 20 the CVBS signal is coming out and goes to the multiplexer 7926 on part II for mixing with teletext lines.

Luminance and chrominance is also going via buffers 7658 and 7651 to a separate Y/C output connector.

The composite sync. (C.S.) is coming into the encoder on pin 10 for NTSC 15734 Hz and for PAL 15625 Hz.

1.9 The time base correction

The TBC-MD 7911 IC is in the VP380 multi standard position working with a 14,32 MHz Kristal 5700 instead of the 17,7 MHz in the VP310.

The TBC-MD is normal in master mode. When a CAV disc is started up the IC is switched for a short moment to slave-mode this is to lock the video from the disc. When the disc is locked to the Ref H (Reference signal) the TBC-MD is switch to master-mode again.

The TBC-MA 7910 is switched between PAL and NTSC via NTSC-A on pin 2.

MEASUREMENTS AND ADJUSTMENTS VIDEO

1. Introduction

1.1 Required measurement equipment

The required measure equipment:

- Oscilloscope 50 MHz with TV triggering
- Frequency counter
- Color monitor with RGB and CVBS and Y/C input
- HF generator multistandard 1 KHz - 10 MHz
- Multimeter
- PAL video test disc 4822 397 30207
- NTSC Video test disc 4822 397 30244

1.2. Adjustment conditions

- When a video disk is required search for a colour bar and the player mode is 'STILL PICTURE' unless otherwise mentioned.
- Carry out adjustments after a warm-up time of 5 minutes

1.3. Adjustments when item replaced

Replace	Adjust
7903	5303, 5303, 3338, 5309

2. DC voltages measured with the multimeter

2.1. - Reference point for DC-measurements = GND on connector 1V12.

Measurement point	designation in schematic diagram	Value
connector 6V12	(+5V)	+5.30 Vdc
12 7903	TEA7650 pin 12 = +5VA	+5.18 Vdc
30 7903	TEA7650 pin 30 = +5VC	+5.13 Vdc
34 7911	TBC-MD pin 34 = +5VDD	+5.17 Vdc
24 7911	TBC-MD pin 24 = +5VE	+5.1 Vdc
6 7910	TBC-MA pin 6 = +5VH	+4.8 Vdc
19 7925	CXA1145 pin 19 = +5VH	+4.91 Vdc
20 7910	TBC-MA pin 20 = +5VN	+5.13 Vdc
1 7501	12V regulator input	+13 Vdc
3 7501	12V regulator output	+12 Vdc
1 7922	RGB decoder supply	+11.5 Vdc
8 7913	MC1458 - loopfilter	+12.4 Vdc
4 7913	MC1458 - loopfilter	-12.0 Vdc
1 7902	Drop out CCD	+9.1 Vdc
2 1900	TFU VCO/2 = ELCO 2805/+	+9.25 Vdc
7 1900	TFU VCO/7 = ELCO 2806/-	-9.25 Vdc
10 7904	Video CCD pin 10	+5.00 Vdc
13 7904	Video CCD pin 13	+4.80 Vdc
D6401/cathode	Video CCD	+5.6 Vdc
D6402/anode	Video CCD	-3.6 Vdc
1 7904	Video CCD pin 1	-3.0 Vdc
7 7904	Video CCD pin 7/Vref	+1.00 Vdc
14 7925	CXA1145 - Vref pin 14	+2.00 Vdc
C2601/+	Vref - sync.sep.	+2.14 Vdc
HUE INPUT:		
24 7922	RGB decoder in PAL-mode	9,4 Vdc
24 7922	RGB decoder in NTSC-mode	7,5 Vdc
VIDEO MUTE:		
C-7306	Video (when INTVID is low, mute)	3,4 Vdc
C-7682	Video (mute)	1,46 Vdc
RGB DECODER		
14 7920	Luminance to RGB decoder in PAL-mode	2,2 Vdc
14 7920	Luminance to RGB decoder NTSC-mode.	2,37 Vdc

3. AC voltages and signals measured with the scope

3.1 - HF-AV input measure point connect 2V11.

- CAV disc - inside 400 mV pp
- CAV disc - outside 800 mV pp.

3.2 MTF circuit

- Disconnect V11
- Apply a HF generator signal to 2V11 and GND to 3V11
- Switch the player on
- Connect 5V13 to ground (PAL-mode)
- Connect +3 volt to 6-7903
- Measure on 14 7903
- Set the HF-generator to 8 MHz/400 mV
- Adjust 5305 for max. amplitude
- Disconnect 5V13 from ground (NTSC-mode)
- Set the HF-generator to 10 MHz/400 mV
- Adjust 5303 for max. amplitude.

4. Drop out circuit

4.1 Input CCD filter

- Power off
- Inject via a capacitor of 220 nF in serial with a resistor of 3k3 a frequency of 4,433618 MHz at 3315 and 3317
- Measure on junction 3315 and 3317
- Adjust 5302 for minimum amplitude.

4.2 Drop out amplitude

- Search for drop-out on the PAL test disc
- Adjust 3338 for the drop-out amplitude has the same value as normal video
- Check on T.V. screen.

5. Synchronization signals (sync) and special burst separation

5.1 Chroma separator

- Use the scope with a 10:1 probe
- Measure via a 10 k resistor on 10-7910
- Adjust 5309 for max. amplitude.

6. Time base control

6.1 CCD pre filter 5307

- Player off
- Inject via a 220 nF capacitor a HF signal 15,5 MHz/1 Vpp on 29-7903
- Measure via a 10 K resistor on 5-7904 adjust 5307 for minimum frequency.

7. Noise filter

7.1 Adjusting noise filter 5380

- Player off
- Inject via a serial circuit of a capacitor of 220 nF and a 1K resistor to junction 3389 and 5380 a HF signal of 4,43 MHz
- Measure on 35-7903
- Adjust 5380 for minimum amplitude.

8. Oscillators

8.1. TBC MD

- Connect 5V13 to ground (PAL-mode)
- Connect 9V16 to ground (master-mode)
- Measure via a 10:1 probe on 40-7911 with a frequency counter
- Adjust 2708 for a frequency of 7.500.000 Hz \pm 5 Hz
- Connect 5V13 to +5V (NTSC-mode)
- Measure via a 10:1 probe on 40-7911 with a frequency counter
- Adjust 2705 for a frequency of 7.159.000 Hz \pm 5 Hz.

8.2. PAL-encoder

- Connect 10V16 to +5V (Q-PAL = Pal-mode)
- Measure via a 10:1 probe with a frequency counter on 8-7924
- Adjust 2675 for a frequency of 4.433.618 Hz \pm 3 Hz.

9. Luminance/chrominance separators**9.1. PAL filter**

- Connect 5V13 to ground and INTVID (8V16) to ground (=mute)
- Connect the cathode of 6551 to ground
- Measure on 8-7922, the luminance input of the RGB decoder
- Adjust 5532 for minimum chrominance signal
- Measure on 4-7922, the chrominance input of the RGB decoder
- Adjust 5533 for maximum chrominance signal
- Search for a CROSS-HATCH signal on the PAL test disc and measure on 8-7922 again
- Adjust 5531 for an equal amplitude of the under and over shoots.

9.2. NTSC-Comb filter

- Connect 5V13 to +5V (NTSC-mode)
- Inject a HF signal of 3,579545 MHz/1,5V pp to C-7306
- Measure on e-7513 (lum-out)
- Adjust 3518 to minimum amplitude
- Adjust 5514 to minimum amplitude
- Repeat adjustments 3518 and 5514 until a minimum is reached
- Disconnect HF-generator
- Inject via a capacitor of 1 μ F a frequency of 3,25 MHz into e-7513
- Measure on 8-7922
- Adjust 5515 for a minimum amplitude
- Disconnect HF-generator
- Inject via a capacitor of 1 μ F a frequency of 3,57954 MHz into e-7512
- Measure on 4-7922
- Adjust 5516 for maximum amplitude.

10. RGB-decoder (PAL)**10.1 RGB filters**

- Player off
- Inject via a resistor of 750 Ω on junction 3615 and 2615 a frequency of 7,78 MHz
- Measure on 3614
- Adjust 5614 for minimum amplitude
- Repeat this procedure for : junction 3620 and 2617 measure on 3611 and adjust 5611, junction 3609 and 2606 a measure on 3608 and adjust 5601.

10.2 Brightness 3542

- Use the PAL-video test disc, search for picture number 505 (black picture)
- Measure on B-out connect 5V15
- Adjust 3542 for a black level of 2-5 mVp relative to black level during CVBS sync.

10.3 Contrast 3545

- Use the PAL-video test disc, search for picture number 405
- Measure on B-out connector 5V15
- Adjust 3545 for an amplitude of 700 mVp relative to blanking level.

10.4 Minimum chroma on white colour 3611 and 3608

- Use the PAL-video test disc, search for picture number 405
- Measure on G-out on connector 4V15 and R-out on connector 3V15
- Adjust 3611 and 3608 for the same amplitude as for B-out.

10.5 8,86 MHz oscillator

- Use the PAL-video test disc search for picture number 10.000 (red picture)
- Play mode reverse
- Adjust 2584 until no colour disturbance is visible in the upper part of the TV-screen.

10.6 PAL demodulator 3626

- Use the PAL-video test disc search for picture number 1690 (DEM-pattern)
- Measure on B-out connector 5V15.
Scope : time base 10 μ sec.div. trigger on TVL on CVBS out
- Adjust 3626 for minimum amplitude jitter in the last two levels of the scope-picture.

10.7 PAL delay line 5623/5621

- Use the Pal video test disc search for picture number 250 (colour bar)
- Measure on B-out connector 5V15
- Adjust 5623 and/or 5621 for minimum amplitude jitter.

10.8 Saturation 3551

- Use Pal video test disc search for a colour bar
- Measure on B-out connector 5V15
- Adjust 3551 for equal amplitudes of the signals of the colours yellow, cyan and green.

11. RGB decoder (NTSC)**11.1 NTSC comb. filter**

- Use the NTSC-video test disc search for a colour bar
- Measure on B-out connector 5V15
- Adjust 2581 for minimum jitter in the cyan and blue colour signals
- Check the TV screen for a stable picture
- Adjust 3580 (HUE) for the right colour
- Adjust 3518 for minimum amplitude jitter
- Adjust 5514 and/or 5511 for minimum jitter
- Repeat adjustment 3518.

11.2 NTSC decoder 2581

- Play a NTSC colour bar reverse
- Adjust 2581 for minimum colour disturbances in the upper part of the TV screen.

Name: VII

Coming from: Sigma pi panel connector 13

Pin number	Name	IN/OUT	Level	Comment
1	N.C.	IN	+5V	Negative pulses from 70-200 μ s in situation off track in Still-mode not used in the VP380.
2	HF-AV	IN	800-1100 mV _{pp} on 5.5Vdc	
3	GND	IN		

Name: V12

Coming from: Power supply connector p4

Pin number	Name	IN/OUT	Level	Comment
1	GND	IN		
2	-13Vdc	IN	Ripple 150 mV _{pp}	During Play CAV
3	GND	IN		
4	+13Vdc	IN	Ripple 150 mV _{pp}	During Play CAV

Name: V13

Coming from: Servo panel connector S9

Pin number	Name	IN/OUT	Level	Comment
1	GND	IN		
2	DRQ	IN	+5V	Pulse during video line. 16-20 and 329-333. Source: BC 848b open collector with a 4k7 pull-up resistor.
3	DATA	OUT	+5V	Data pulses during DRQ. Load = input for the 24-bit decoder 21-7202.
4	RADSRVN	IN	+5V	During: out of radial tracking with Jump or Stop. Source: 31-7201 I/O Expander.
5	NTSC	IN	+5V	With NTSC disc. Source: I/O gate of the 24-bit decoder 20-7202.
6	TPI	IN	+5V	Low during off track. Source: LM393 7-7300 via resistor 4k7 and diode and 4k7 pull-up resistor.

Name: V14

Coming from: Motor panel connector M4

Pin number	Name	IN/OUT	Level	Comment
1	PHLOCK	IN	+5V	During phase lock. Source: 49-7001-4A via serie resistor 3404 (470 Ω) and capacitor 2404 (100pF) to ground.
2	GND	OUT		
3	CS1	OUT	+5V	During sync. for time base correction. Load: capacitor 2200 (100pF) to ground and via a serie resistor 3106 (470 Ω) to 53-7001.
4	HREF	OUT	+5V	During reference-pulse. In mid-position of active video line (CVBS-out). Load: capacitor 2408 (100pF) to ground and via serie resistor 3405 (470 Ω) to 52-7001.

12-4

Name: V15

Coming from: Connector panel connector CN5

Pin number	Name	IN/OUT	Level	Comment
1	CVBS	OUT	2V _{pp}	On 2Vdc. Load: approx. 2k Ω after capacitor 2003 (47 μ F).
2	GND	OUT		
3	R0	OUT	700mV _{pp}	Load: 75 Ω when monitor is connected via scart connector.
4	G0	OUT	700mV _{pp}	Load: 75 Ω when monitor is connected via scart connector.
5	B0	OUT	700mV _{pp}	Load: 75 Ω when monitor is connected via scart connector.
6	GND	OUT		

Name: V16

Coming from: μ processor panel connector U15

Pin number	Name	IN/OUT	Level	Comment
1	VBLANK	IN	+5V	During vertical blanking. Active: during video line 58-73. Source: character generator 14-7106.
2	GND	IN		
3	Ri	IN	+5V	During white characters. Source: character generator 11-7106.
4	Gi	IN	+5V	During white characters. Source: character generator 12-7106.
5	Bi	IN	+5V	During white characters. Source: character generator 13-7106.
6	HOR	OUT	+5V	Between horizontal sync. pulses. Load: character generator 17-7106.
7	VER	OUT	+5V	Between vertical sync. pulses. Load: character generator 16-7106 and 13-7101.
8	INTVID	IN	+5V	When no video mute is needed. Source: DUART 13-7105.
9	SLV/MAS	IN	+5V	In slave mode when PLOCK is LOW. Source: Duart 28-7105.
10	QPAL	IN	+5V	During CVBS out with PAL chrominance. Source: Duart 12-7105.

Name: V17

Coming from: Analog Audio panel connector B2

Pin number	Name	IN/OUT	Level	Comment
1	NTSC-A	OUT	+5V	With NTSC Disc. Source: collector BC 858b with 1k Ω resistor to ground.
2	HF-audio	OUT	60mV _{pp}	Load: HF audio level (when HF-AV = 800mV _{pp}). DC level = 2Vdc via 68 Ω resistor. Load: 47 Ω resistor and 470pF capacitor to ground after 22nF capacitor.
3	GND	OUT		
4	TBC-ERR	OUT	800mV _{pp}	DC level = 0V. Source: via 3811 (1k) from 7-7913 (opamp). Load: resistor of 15k Ω via capacitor of 22nF.

Name: V18

Coming from: Y/C connector

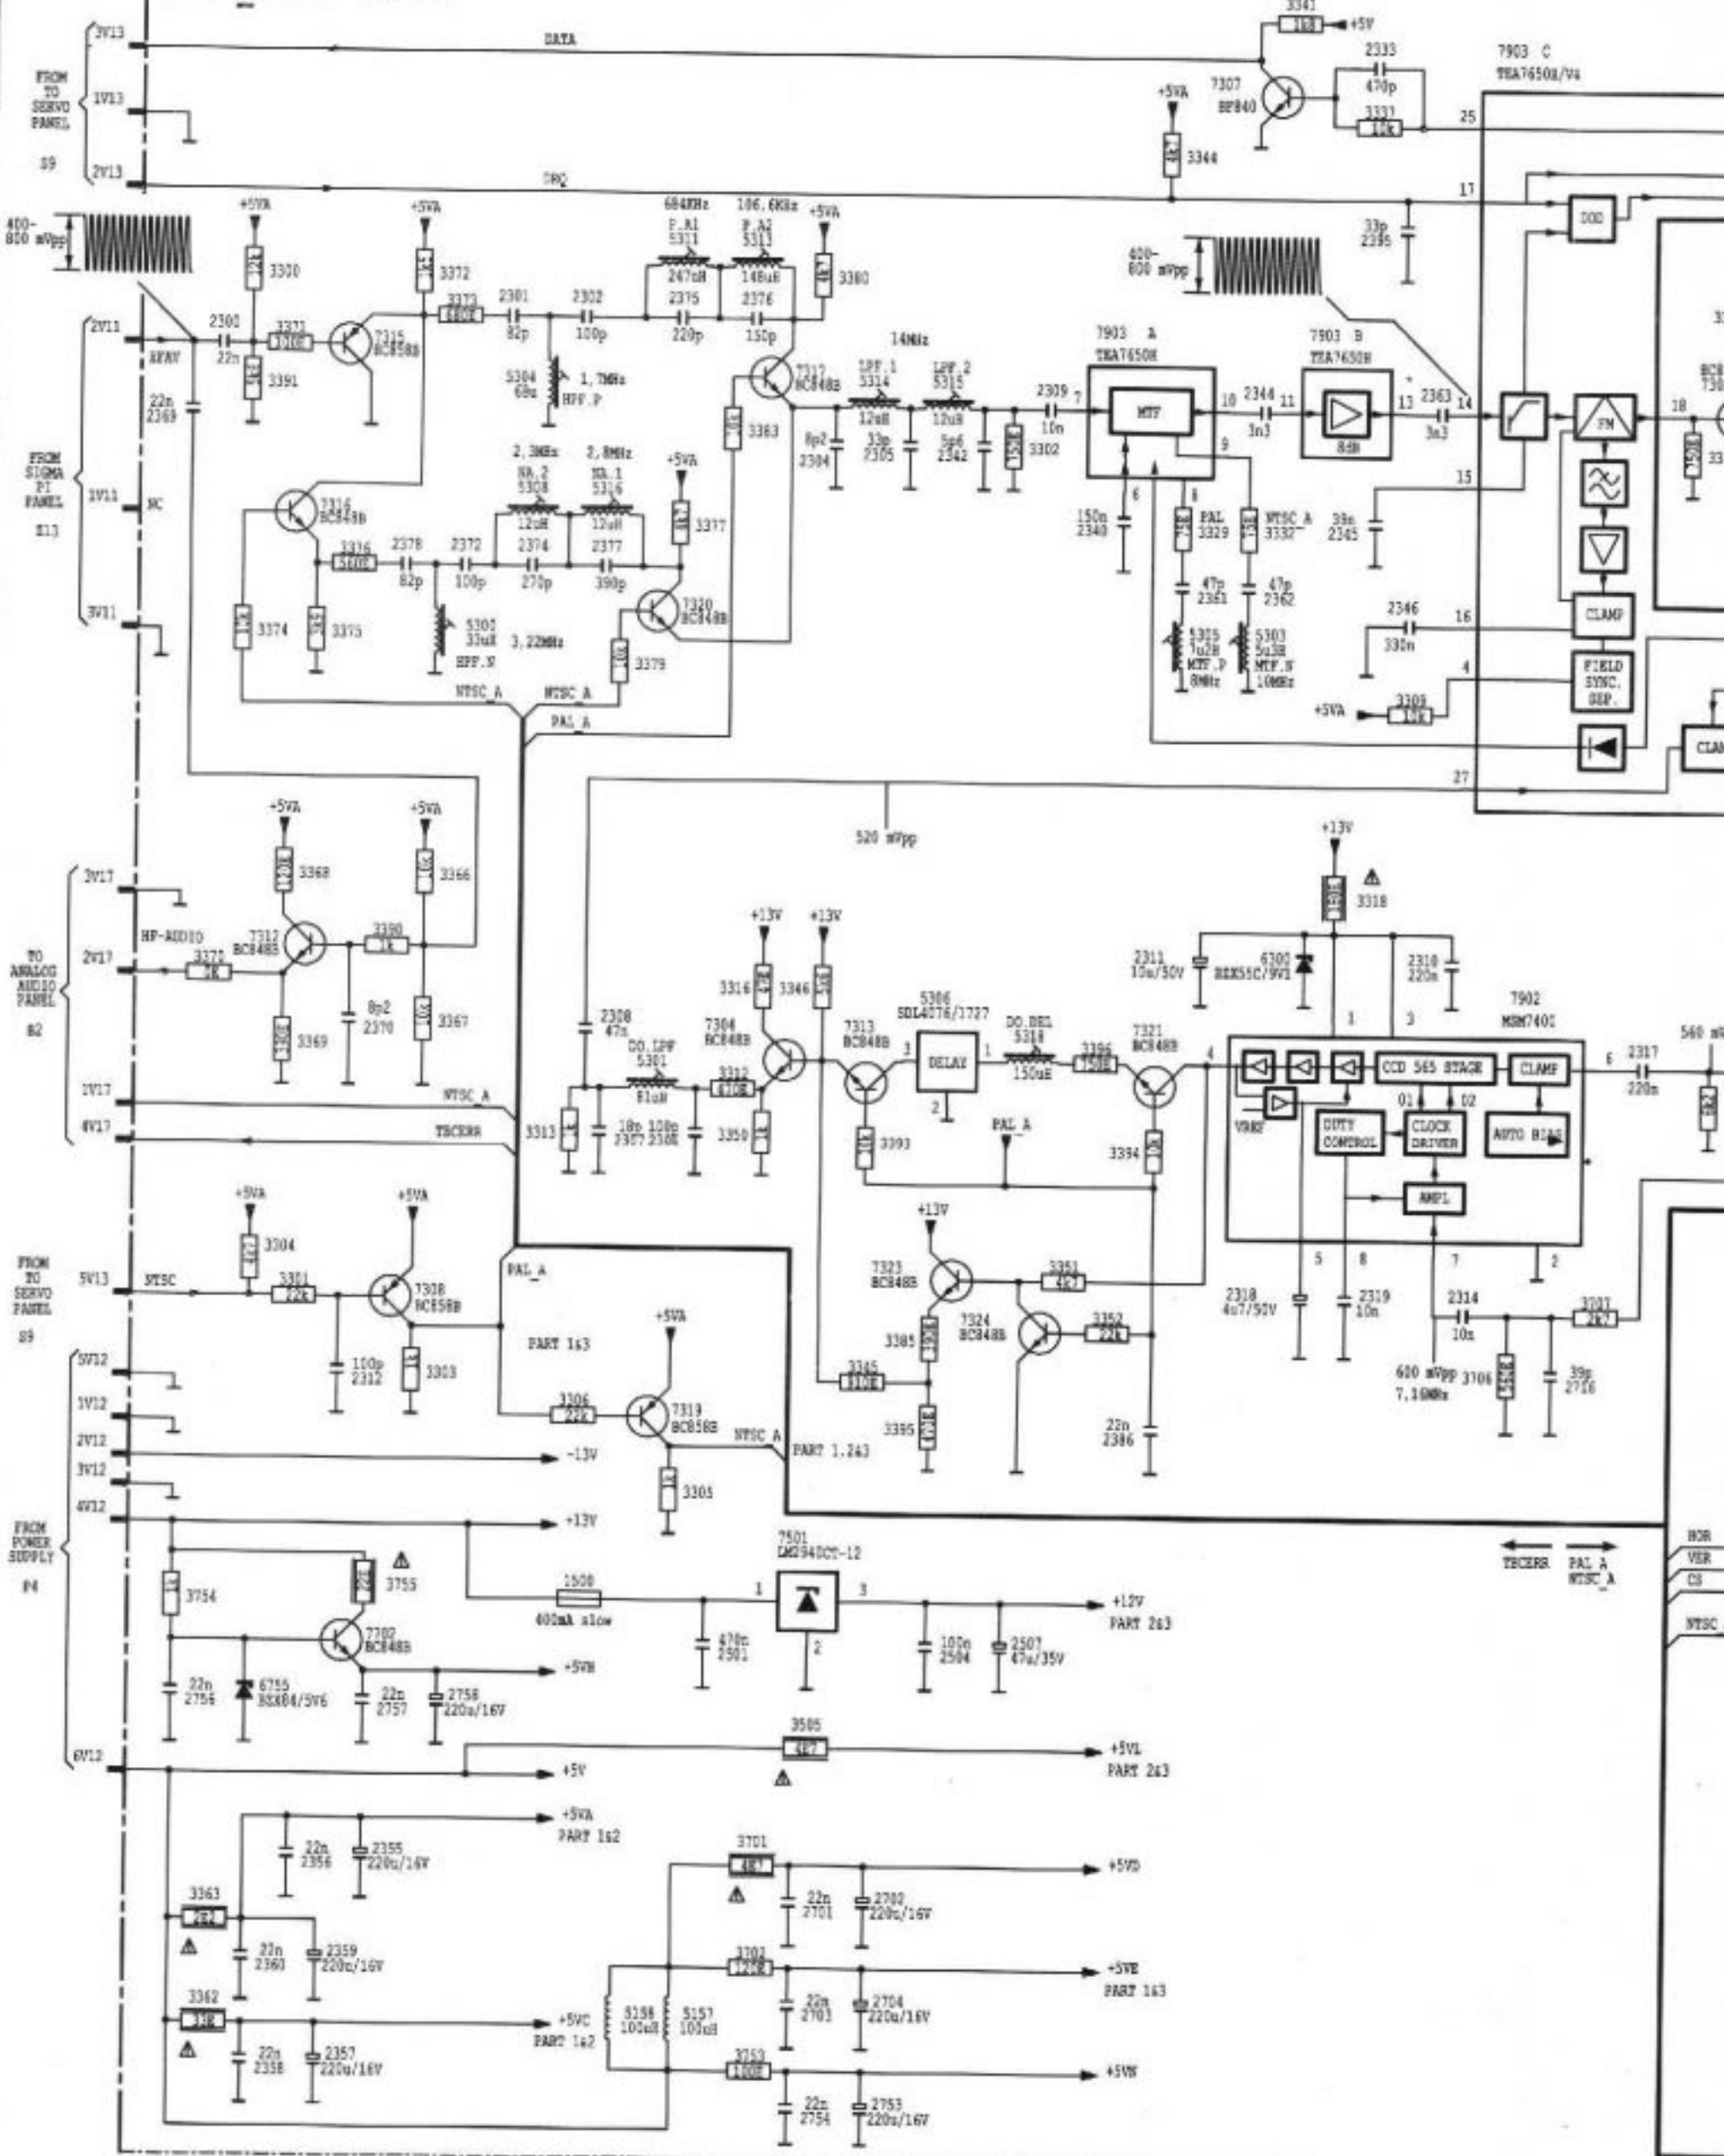

Pin number	Name	IN/OUT	Level	Comment
1	C	OUT	300mV _{pp}	Burst, when Y/C connector is terminated with 75Ω. Source: e-7652 via 3648 (68Ω).
2	GND	OUT		
3	GND	OUT		
4	Y	OUT	1V _{pp}	Luminance, when Y/C connector is terminated with 75Ω. Source: e-7659 via 3657 (68Ω).

Name: V19

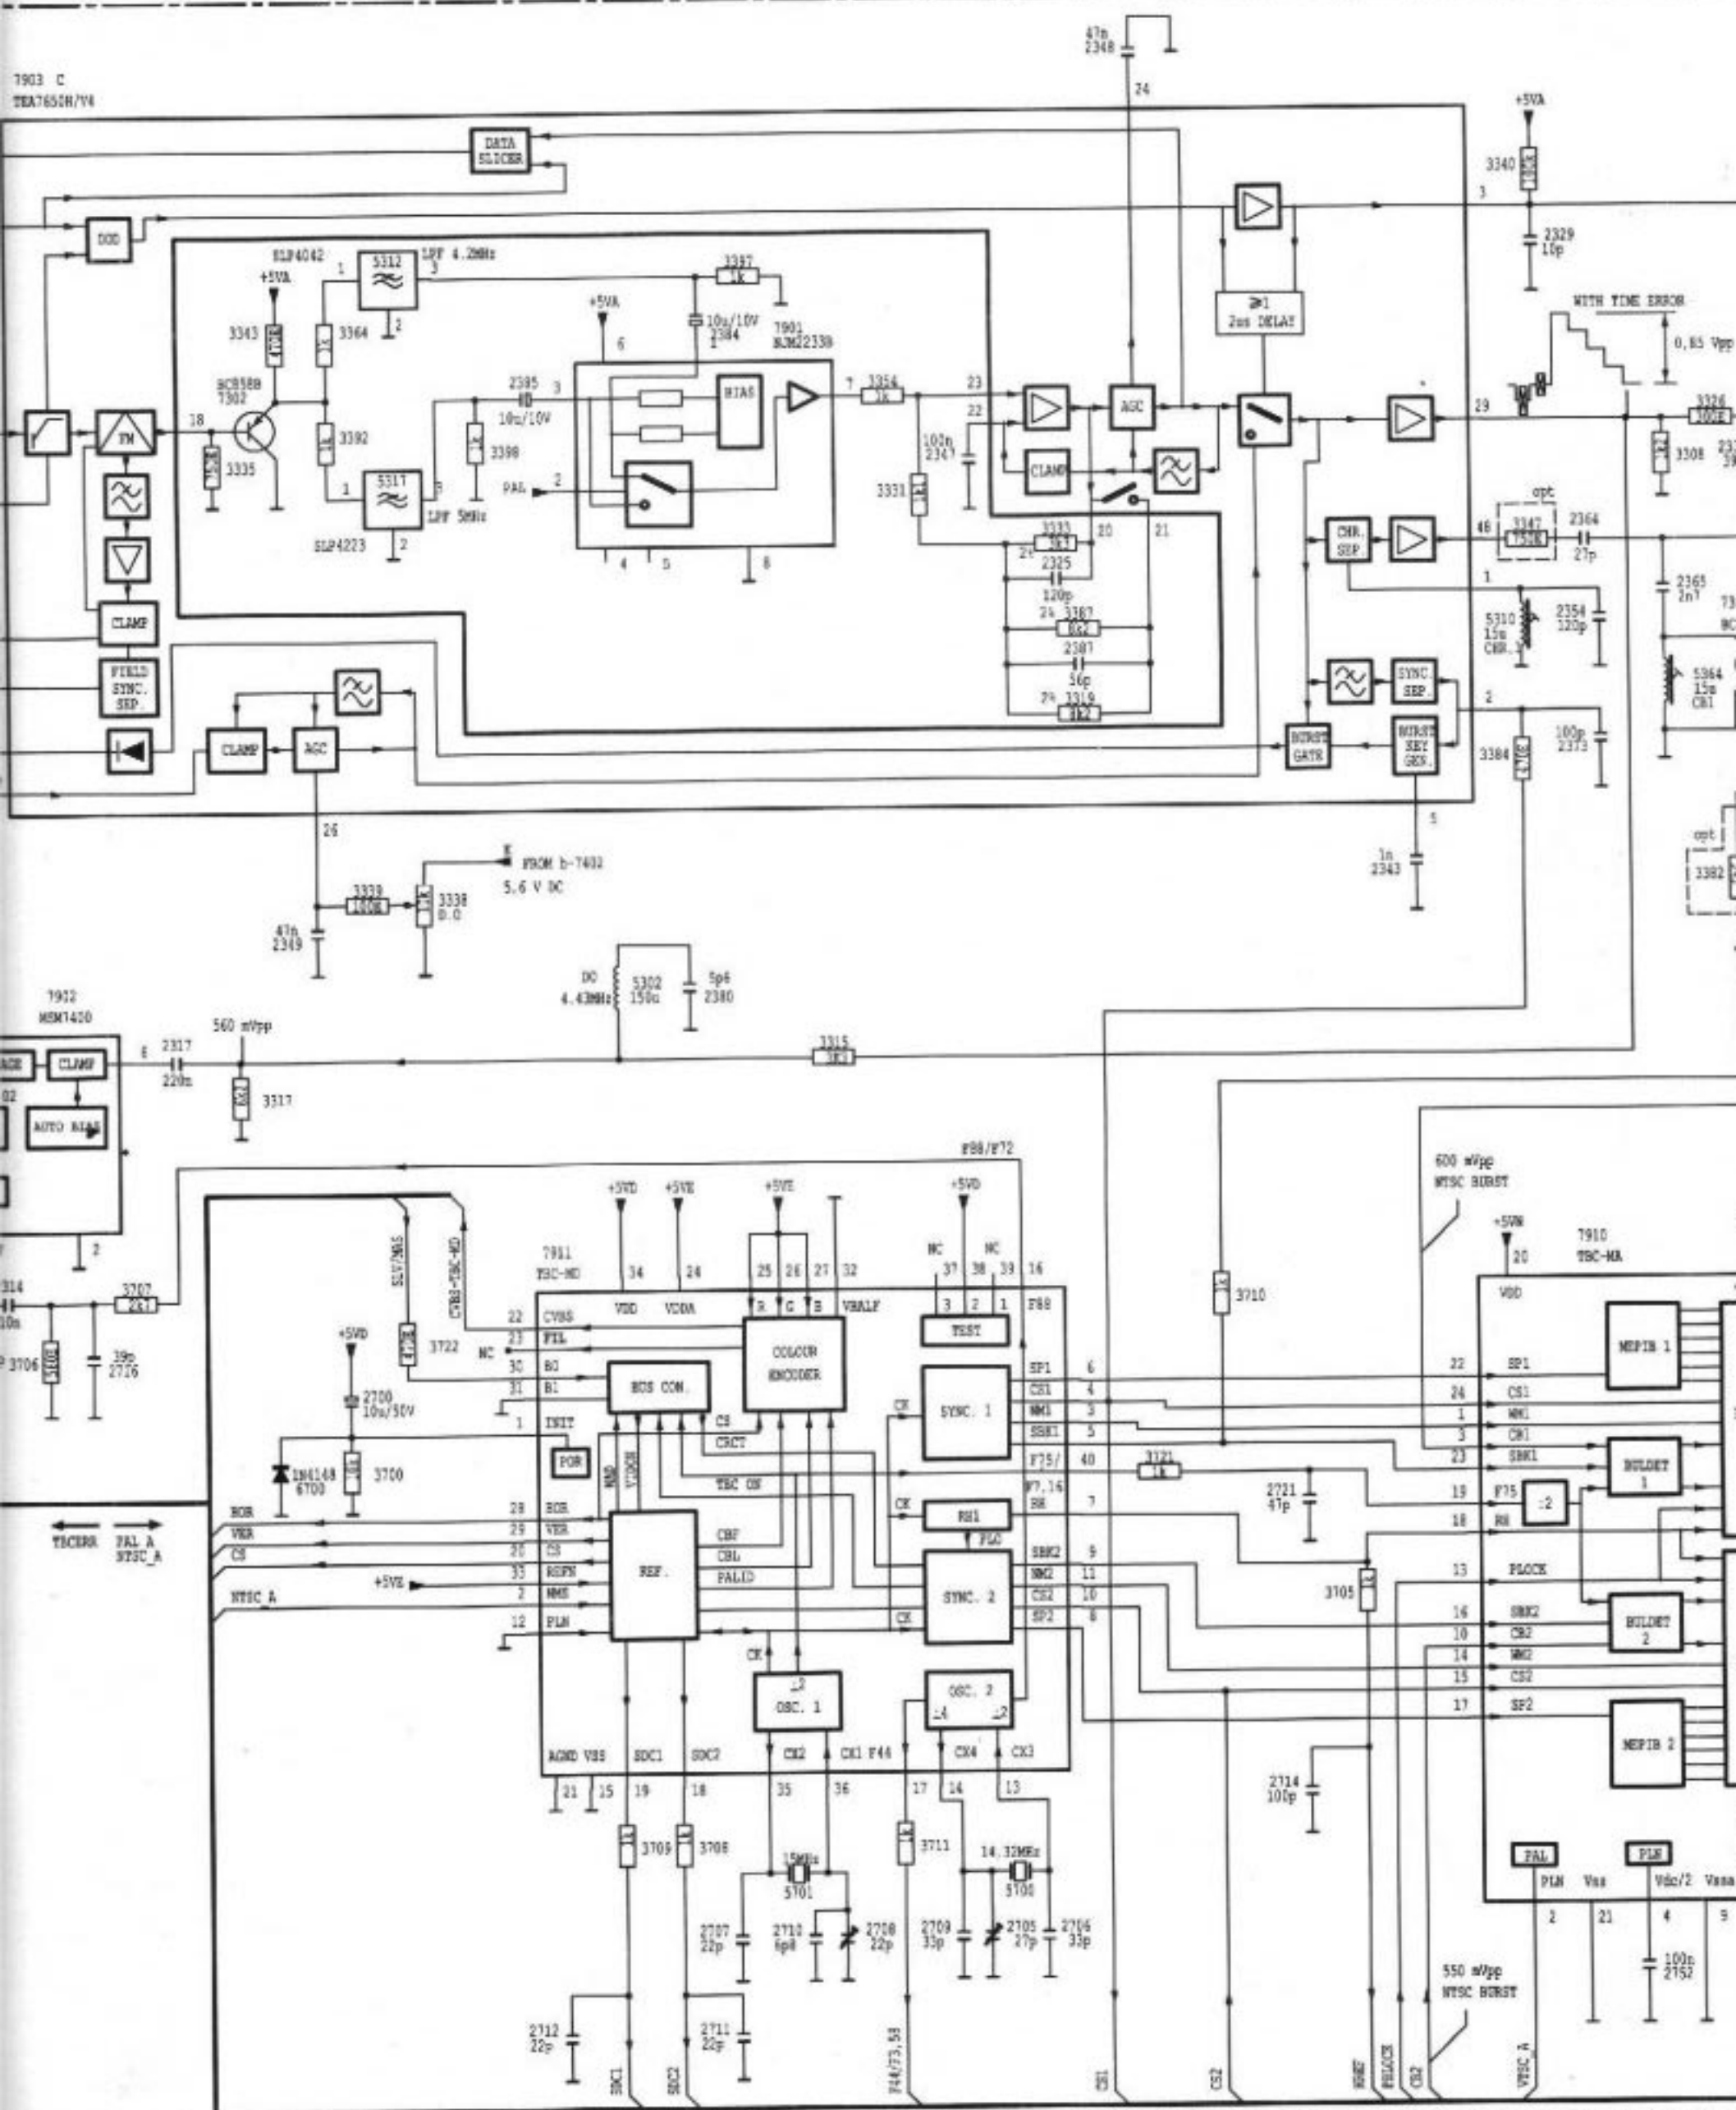

Coming from: front panel (LED's) connector K54.

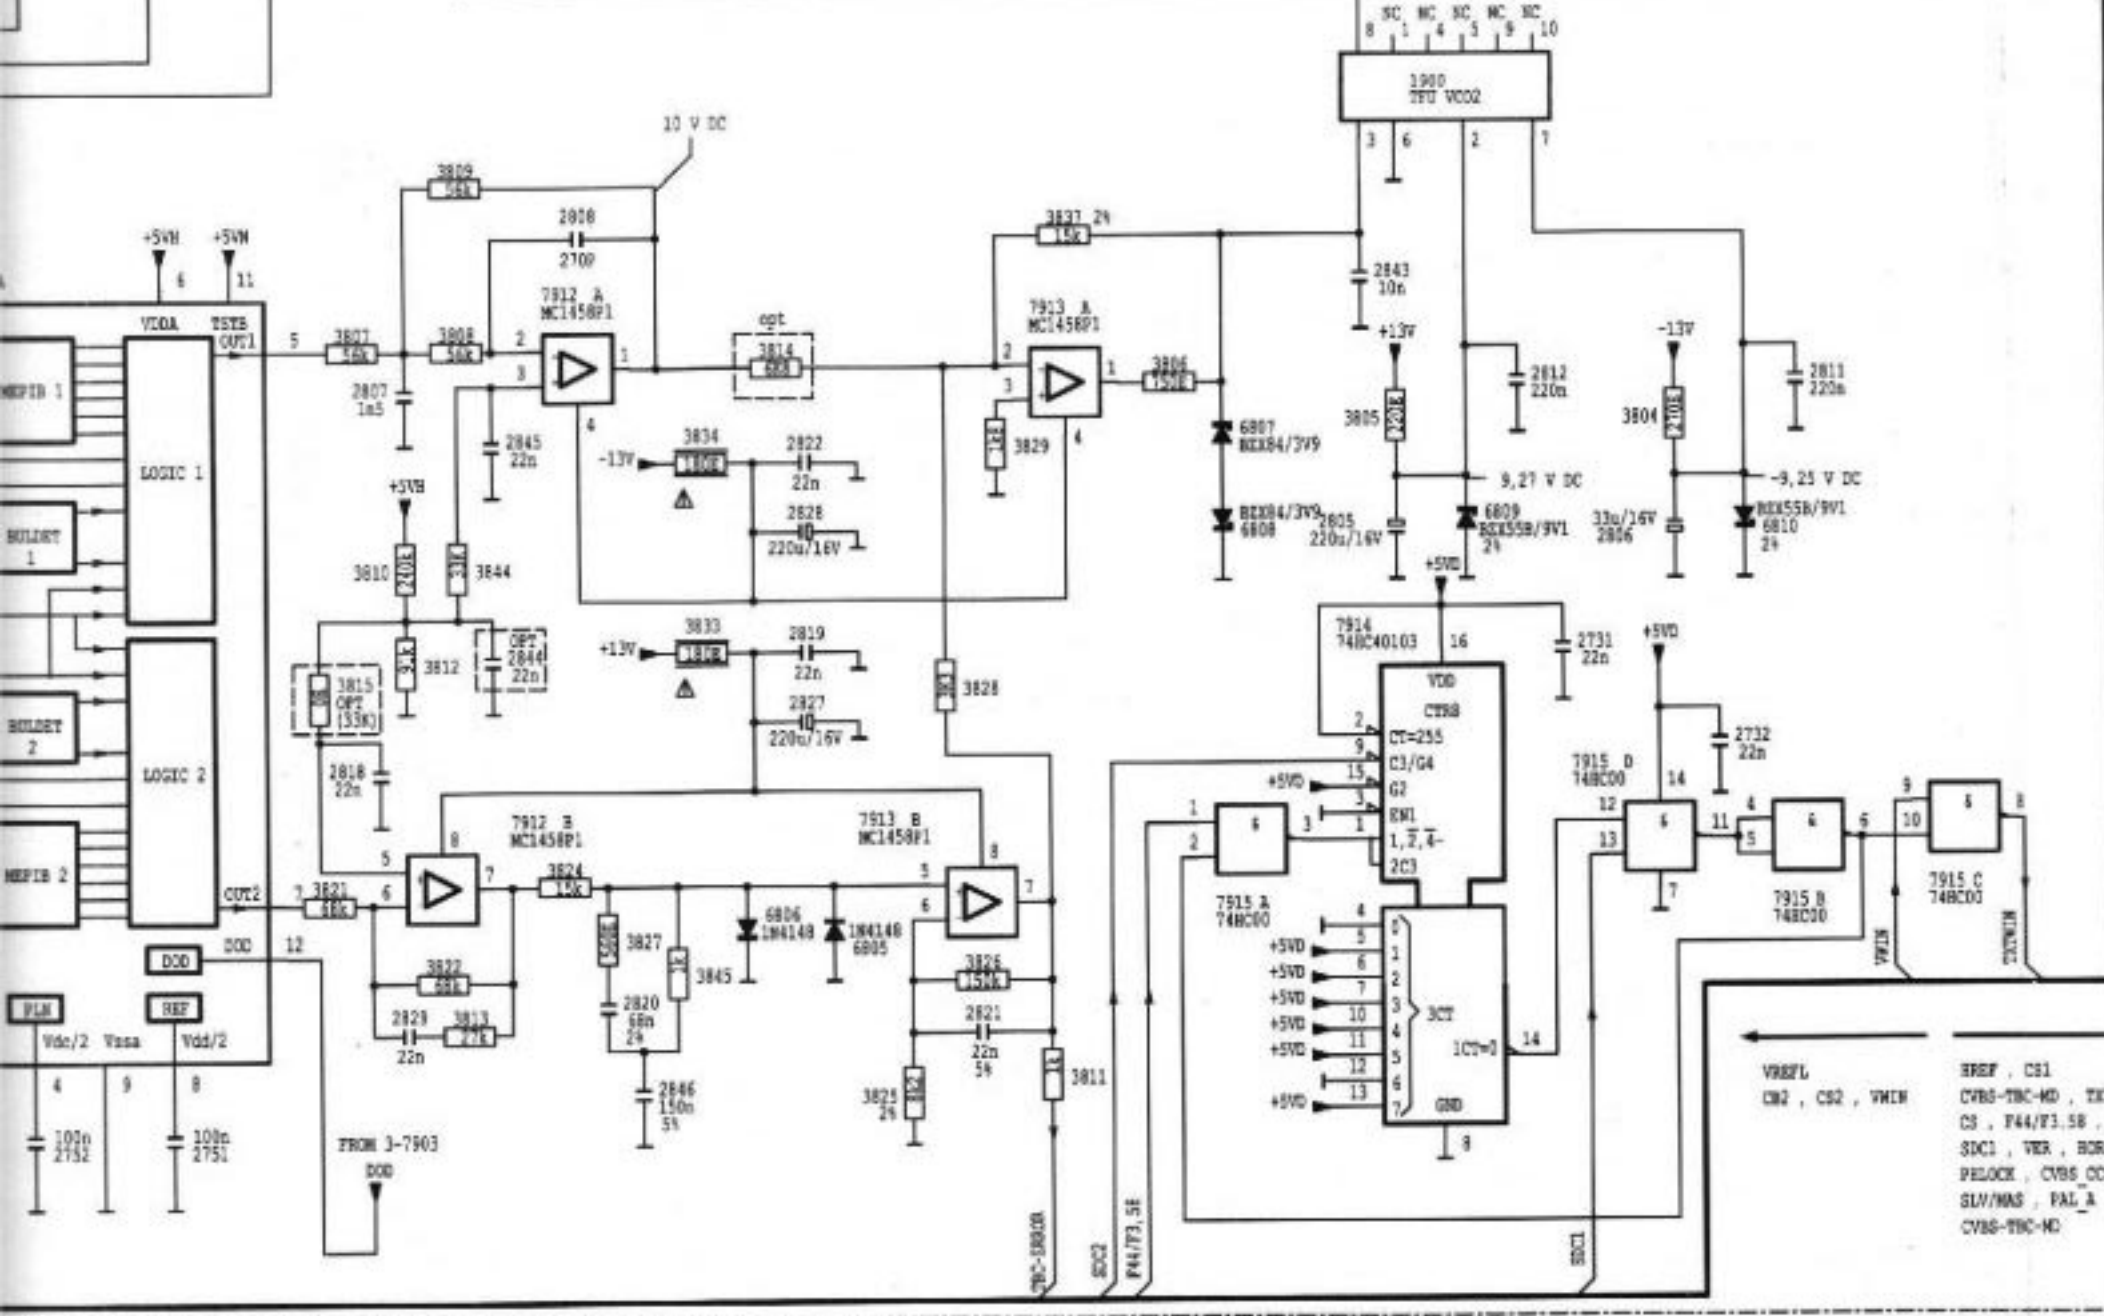

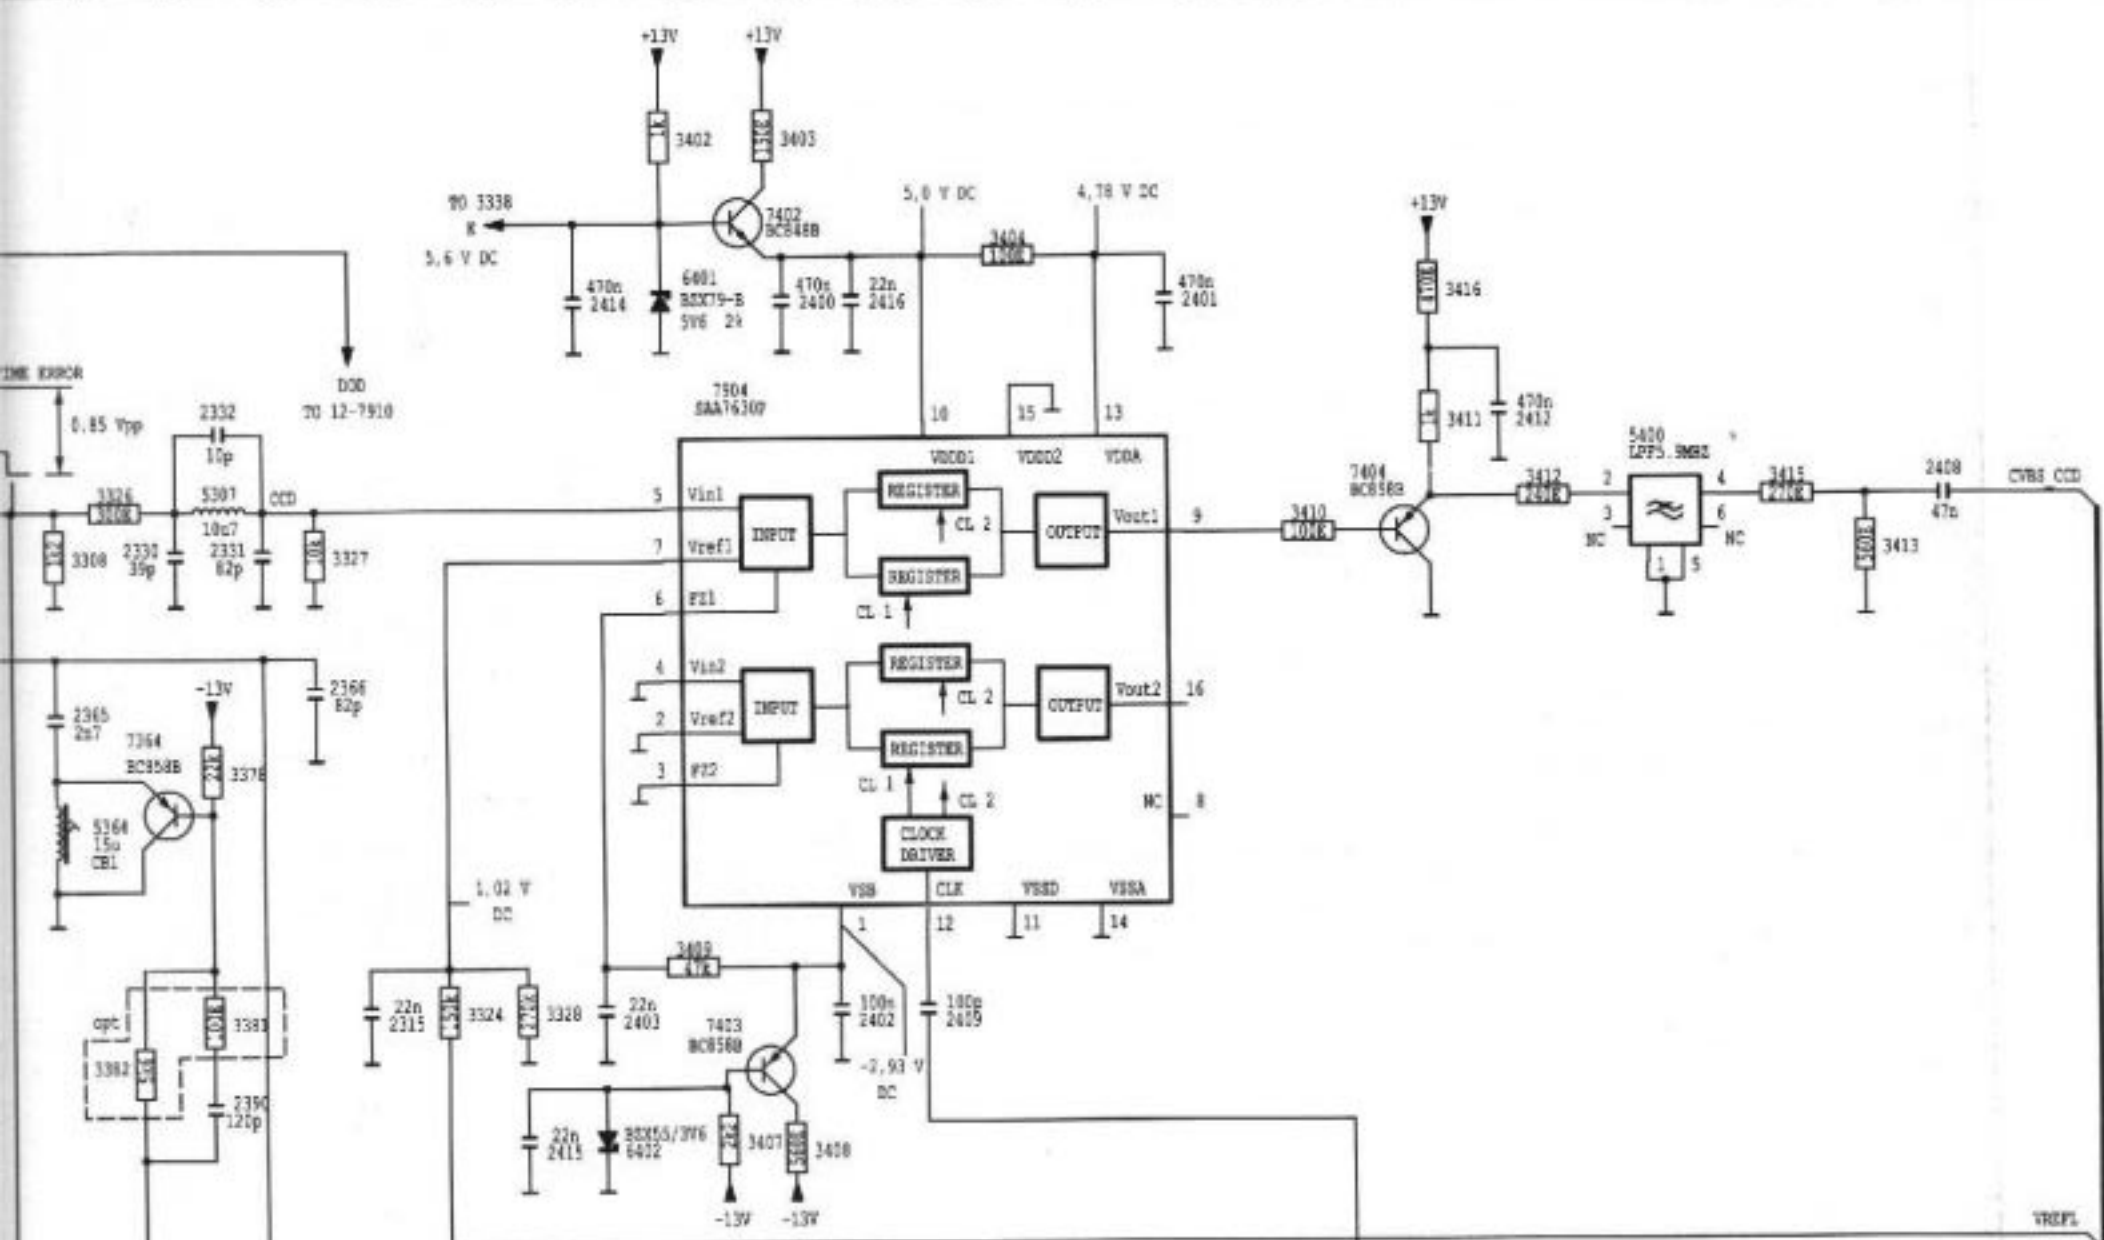

Pin number	Name	IN/OUT	Level	Comment
1	5VL	OUT	+5Vdc	Supply via 3505 (4,7Ω.) non flammable resistor. Load: 2×led via 330Ω resistor.
2	GND	OUT		
3	NTSC-A	OUT	+5Vdc	With NTSC-disc. Source: +5VA via 7319 (BC858b) and 3305 (1k) to ground. Load: resistor of 33k.
