Subject: Service Advisory

During the production run of Star Wars we are manufacturing the display controller board up in two different formats. One format uses a single 4 Meg. Eprom in position U12, the other uses two 2 Meg. Eproms, one in position U12 and one in position U14.

When the board uses a single 4 Meg. Eprom, the zero ohm resistor will be removed from the board at position R11. (This board will have the part number 520-5055-01.)

When the board uses two 2 Meg. Eproms, the zero ohm resistor or jumper will be installed in the board at position R11. (This board will have the part number 520-5055-00.)

Best Regards,

Jim & Arnie
