I. INSTALLATION

A. SET—UP

1. Carefully inspect the exterior of the game for any damage which might have occurred during shipment.
2. Remove the two screws from the back door, that were used for extra security during shipping.
3. Unlock and open the rear cabinet door.
4. Check that all plug in connectors are seated firmly. The connectors are keyed so they will only go in one way.
5. Remove the binding strap from the line cord, and install the line cord plate in the groove provided (see photo).
6. Adjust the cabinet levelers as necessary.

B. CHECK-OUT

1. Check that all cables are free of moving parts.
2. Check for any loose wires.
3. Check for loose solder or foreign matter on switches and power supply assemblies.
4. Be certain all fuses are seated firmly.
5. Be sure transformer wiring corresponds to the supply voltage.
6. Refer to section VI to make all the necessary game adjustments.
7. Reassemble the game.
8. Plug the line cord into a properly grounded 3-wire receptacle ONLY!!

C. CONTROL PANEL REMOVAL

1. Unplug the game.
2. Unlock and open the coin chute door.
3. Reach in through the coin chute door and remove the wing nut and flat washer from each of the two carriage bolts which secure the control panel to the game. Remove the carriage bolts.
4. Pull the control panel back, grasp it at the front edge as far back as it will go (approximately 1/4").
5. Raise the front of the control panel approximately one inch above its supports and lift the entire assembly high enough to disconnect plugs A9J1/A9P1 and A9J2/A9P2.
6. Remove the entire control panel assembly from the game.
7. Track Ball assembly and leaf-switches are now accessible for removal or cleaning.

D. MONITOR REMOVAL

1. Unplug the game.
2. Perform the control panel assembly removal procedure (Section C).
3. Remove the outside shield, glass and monitor mask and put them aside in a secure place.
4. Unlock and open the rear cabinet door.
5. NOTE: The color monitor contains HIGH VOLTAGES delivering LETHAL quantities of energy. Do not attempt to service the monitor until you have shorted the anode plug on the picture tube to ground.
6. Disconnect the video plug A17J1, the monitor power supply plug A12J3/A12P3 and the ground wire from the monitor chassis.
7. From the rear of the game, remove the one unit and two washers from each of the four carriage bolts used to secure the monitor to the platform.
8. From the front of the game, remove the monitor, being careful to clear all cables from the CRT neck.
9. For reassembly, reverse the above procedure.

II. INITIALIZATION, III. GAME OPERATION

II. INITIALIZATION

TURN GAME ON

Immediately, all of the illumination lamps turn on. These include the control panel lamps, the coin chute lamps and the speaker marquee lamp.

1. Gottlieb logo
2. High Game to Date screen
3. Game Play

AFTER A TEN SECOND DELAY

- A. The attract mode appears on the screen.
- B. The playing field cycles through the following:

DEPRESSING ANY CONTROL BUTTON

The instruction set will now appear on the playing field and follow through game play and strategies.

III. GAME OPERATION

A. GAME START

1. Insert coins into coin chute.
 - a. Coin chute tune is played.
 - b. Total credits are displayed on screen.
2. Press one or two player button to start game.
(3 ships/25¢ or 7 ships/50¢)
 - a. Instructions are displayed on screen.
 - b. Total credits are decreased by one.
 - c. Game initializes.

2. The other player's display will be blank.
3. When the player loses his ship, any bonus earned is scored.

C. SECOND PLAYER

1. Additional player is indicated by a zero in the second player's display.

D. EXTRA SHIPS/DECOYS

1. Extra ships are earned (dependent on Switches #7 and #8) by achieving certain score levels.
2. Extra decoys are earned by knocking down both sets of control rods.

B. FIRST PLAYER

1. The first player's score displays a zero.

IV. GAME PLAY AND SCORING

HOW TO PLAY

The game activity starts with the player's ship contained within the heart of a nuclear reactor. The player moves his ship using a track ball, and has the use of a rapid fire energy button and a decoy button to protect himself.

During the game play, the core expands as the enemy particles attempt to destroy the player's ship by deflecting it against the kill wall. Simultaneously, the player must destroy the enemy particles by using his ship to deflect them against the kill wall.

Pushing the energy button (located on the control panel) when the player's ship is in contact with an enemy particle, will increase the force applied to both the player's ship and enemy particle. When the decoy button is pushed, a decoy will emerge from the player's ship. The decoy will remain stationary at the point where the ship was located when the button was pushed. The decoy confuses the enemy so that they attack the decoy instead of the player. The decoy cannot be destroyed and should be placed in one of three positions:

1. Next to a kill wall.
2. In front of the control rods.
3. Inside the entrance to the bonus chambers.

In doing so, the enemy particles will be lured into a position which will allow the player to:

1. Destroy them against a kill wall.
 2. Destroy the control rods.
 3. Trap them in the bonus chamber.
- Knocking down either set of control rods, with enemy particles, will reduce the size of the core.
 - Knocking down both sets of control rods will add an extra decoy.

- After every 15,000 points, the player earns one extra ship. (Dependent on switches #7 and #8.)

While the enemy particles are in the bonus chambers, they will deflect off one another and the walls. As they are deflected off the walls, bonus is scored. To achieve maximum bonus, the player must use the ENERGY button to hold the enemy particles in the bonus chamber as long as possible.

The player earns 15 points per bounce during the early rounds and 15+ per bounce as the game progresses. On each round, point values per bounce increase.

As the play progresses, the reactor core continually grows in size, which decreases the usable playfield.

During the early rounds the core is a rectangular shape which expands outward forcing the player closer to the dangerous kill walls. The player can shrink the core by destroying either set of control rods, or killing the total amount of enemies "TO GO" for each round.

In later rounds the rectangular expanding core is replaced with an expanding and swirling vortex. Unlike the rectangular core, the vortex is deadly to the player. As it enlarges, it will draw the player to its center and destroy him. A skillful player can get out of the vortex even after it has caught him by moving his ship in a clockwise direction.

The ideal game play is a balance of using the decoys and bounce chambers to accumulate large bonus points, extra ships and using the control rods to gain extra decoys.

ROUND PROGRESSIONS

The following chart lists round progressions for Reactor:

Commencing with set three, the outer kill walls become invisible and remain that way for the rest of the game.

In set five and on (round 33), set four repeats itself, but the enemy particles gain more speed and mass, and are harder to kill. The control rods in each set, for the rest of the game will be nine.

IV. GAME PLAY AND SCORING

ROUND PROGRESSIONS

	ROUND	CORE	MAXIMUM ENEMIES ON SCREEN	"TO GO"	CONTROL RODS IN EACH SET
SET 1	1.	Expander	3 Positrons	12	3
	2.	Expander	4 Positrons	16	3
	3.	Expander	5 Positrons	20	5
	4.	Expander	3 Positrons, 1 Nucleon	24	5
	5.	Expander	2 Positrons, 2 Nucleons	32	5
	6.	Expander	3 Nucleons	36	5
	7.	Expander	2 Positrons, 1 Lepton	36	5
	8.	Expander	1 Lepton, 1 Nucleon	40	5
SET 2	9.	Vortex	3 Positrons	12	5
	10.	Vortex	4 Positrons	16	5
	11.	Vortex	5 Positrons	20	5
	12.	Vortex	3 Positrons, 1 Nucleon	24	5
	13.	Vortex	2 Positrons, 2 Nucleons	32	5
	14.	Vortex	3 Nucleons	36	5
	15.	Vortex	2 Positrons, 1 Lepton	36	5
	16.	Vortex	1 Lepton, 1 Nucleon	40	5
SET 3	17.	Expander	3 Pions	12	7
	18.	Expander	4 Pions	16	7
	19.	Expander	5 Pions	20	7
	20.	Expander	3 Pions, 1 Nucleon	24	7
	21.	Expander	2 Pions, 2 Nucleons	32	7
	22.	Expander	3 Nucleons	36	7
	23.	Expander	2 Pions, 1 Lepton	36	7
	24.	Expander	1 Lepton, 1 Nucleon	40	7
SET 4	25.	Vortex	3 Pions	12	7
	26.	Vortex	4 Pions	16	7
	27.	Vortex	5 Pions	20	7
	28.	Vortex	3 Pions, 1 Nucleon	24	7
	29.	Vortex	2 Pions, 2 Nucleons	32	7
	30.	Vortex	3 Nucleons	36	7
	31.	Vortex	2 Pions, 1 Lepton	36	7
	32.	Vortex	1 Lepton, 1 Nucleon	40	7

SCORING

UNUSED DECOYS

- Score 500 points

LEPTONS

- Score 400 points

NUCLEONS

- Score 200 points

NEUTRINOS

- Score 100 points

PIONS

- Score 75 points

POSITRONS

- Score 50 points

PHOTONS

- Do not score.

CONTROL RODS

- Score 50 points

BONUS CHAMBERS

Dependent on Switch #6

ON 15 or 15+

OFF 10 or 10+

- Scores 15 points (Rounds 1-4)
- Scores 16 points (Rounds 5-8)
- Scores 17 points (Rounds 9-12)
- Scores 18 Points (Rounds 13-16)
- Scores XX + 1 point every 4 rounds, etc. . .

CONTROL PANEL INSTRUCTIONS

RULES

- Track Ball controls player movements.
- Bounce enemies into outer wall to destroy them.
- Player will be destroyed by touching outer wall.
- Completing one target bank shrinks core.
- Completing both target banks wins one extra decoy.
- Knock enemy into bonus chamber for bonus points.
- Use ENERGY for more power to repel enemy.
- Use DECOY to distract enemy.

TACTICS

- Lure enemies close to outer wall for easier hits.
- Place decoy by outer wall for easier hits.
- Place decoy inside bonus chamber for big bonus, and be careful!
- Place decoy by target banks to earn more bonus and shrink core.
- Use early rounds to build up decoy reserves for later rounds.
- TO GO indicates number of enemies left in round.

V. SOUND/SPEECH, VI. GAME ADJUSTMENTS / OPTIONS

V. SOUND/SPEECH

ATTRACT MODE

SPEECH	OCCURRENCE
"WARNING CORE UNSTABLE"	When core changes to vortex.

GAME MODE

SPEECH	OCCURRENCE
"WARNING CORE UNSTABLE"	When core changes to vortex.
"2000"	After 2000 bonus is accumulated.
"5000"	After 5000 bonus is accumulated.
"10,000"	After 10,000 bonus is accumulated.
"15,000-55,000"	Every 5000 increment is spoken through 55,000 points.
"40 TO GO"	When there are 40 enemy particles to go.
"32 TO GO"	When there are 32 enemy particles to go.
"24 TO GO"	When there are 24 enemy particles to go.
"16 TO GO"	When there are 16 enemy particles to go.
"8 TO GO"	When there are 8 enemy particles to go.
"ACTIVATE CHAMBER"	When entering BONUS CHAMBER for the first time.

VI. GAME ADJUSTMENTS/OPTIONS

A. CONTROL BOARD SWITCH ADJUSTMENT

SWITCH 1 _____ **INITIATED ATTRACT MODE**
ON Sound and Instructions
OFF Instructions/No Sound

SWITCH 2 _____ **ATTRACT MODE**
ON Sound
OFF No Sound

SWITCH 3 _____ **GAME MODE**
ON Upright
OFF Cocktail

SWITCH 4 _____ **NORMAL/FREE**
ON Normal Game
OFF Free Play

SWITCH 5 _____ **CREDITS/COINS**
ON 1/1
OFF 1/2

SWITCH 6 _____ **BOUNCE CHAMBER**
ON 15 Points
OFF 10 Points

SWITCHES
7 8 _____ **FREE SHIPS**
OFF OFF Every 10,000 Points
ON OFF Every 12,000 Points
ON ON Every 15,000 Points
OFF ON Every 20,000 Points

B. SOUND ADJUSTMENTS

The audio output is controlled by the potentiometer mounted on the service panel assembly (located inside the coin mechanism door).

Turning the potentiometer counter-clockwise will decrease the volume. Turning it clockwise will increase the volume.

IMPORTANT: Each of the potentiometers installed on the Sound/Speech board have been factory adjusted. The potentiometer settings should never be changed when performing the recommended calibration procedure.

C. MONITOR ADJUSTMENTS

Normally, few if any adjustments are required for proper monitor operation. However, after any major repairs to the monitor chassis refer to the attached monitor manual.

VII. BOOKKEEPING AND SELF TEST

BOOKKEEPING

The bookkeeping functions of Reactor (GV-100) are limited to the electro-mechanical coin counter located inside the front door. Every time a coin is inserted into a coin slot, the counter is energized.

SELF TEST

The self-test consists of six functions which may be used to identify problems in the video system and to change program parameters.

The self-test mode is entered by setting the self-test toggle switch located inside the cash door to "TEST". A selection of available tests is displayed on the monitor. To return to the GAME mode at any time, the operator needs only to set the toggle switch back to "GAME".

Selection of tests is done with the push button switch labeled "SELECT". Upon entering the test mode, a flashing arrow points to the first test selection momentarily, depressing the "SELECT" button will advance through each selection one by one.

When the arrow is pointing to the desired test, the operator may begin that test by pressing the "SELECT" button and holding it down until the test appears on the screen.

Once a test has been selected, the operator can return to the selection list by holding down the select switch until it re-appears. The six tests are as follows:

1. MONITOR ADJUSTMENT

Four patterns can be displayed on the screen for adjusting monitor color, brightness, contrast and convergence. The patterns are: Color bars, a cross-hatch, a gray scale, and a dot pattern. By momentarily pressing the select switch, the operator may cycle through the four patterns.

2. MEMORY

For each RAM memory chip; a green check (✓) or red (x) appears signaling that the chip is good or bad respectively.

For each ROM memory chip, a check sum is displayed. If you have a suspect ROM, refer to your distributor for the correct check sum number.

3. SWITCHES/LAMPS

A colored square is displayed for each player button. Pressing a button causes the appropriate

square to change color. For each mechanism, a digit is displayed (initially 0). Inserting a coin into a coin chute will increment the appropriate value without affecting the coin meter.

Each player button contains a lamp. During this test, the lamps are turned on and off in various combinations. This happens independent of any button pressing or coin switch testing. When a lamp is lit, a picture of a light bulb appears on the screen under the appropriate colored square. By making sure the buttons are lit according to the light bulbs shown on the screen, this will determine whether or not the lamps are working properly.

4. OBJECT PRIORITY

Visual inspection must be used to determine the priority of two or more objects occupying the same area of the screen; that is, which objects appear to be in front of others and which are behind.

A total of 62 identical objects are placed on the screen in 4 rows. Each object overlaps another such that the first object appears to be in front, and succeeding objects appear to be placed behind all previous ones. When this display is completed, the procedure is repeated such that each new object appears to be in front of all the previous ones.

5. TRACK BALL

This test allows the operator to align the track ball and check for slippage.

A figure which can be moved by the track ball is placed on a grid. Movement of the figure is scaled down so that the track ball must be spun fairly rapidly to have the figure move an appreciable distance.

The two digit number indicated on the left side of the screen is the absolute value of the difference between the horizontal and vertical distances moved. When the track ball is spun rapidly at a 45° angle, this number should be close to zero.

6. DIP SWITCHES

A functional description of the eight Dip Switches located on the Logic Board Assy. is displayed. Changing any switch will cause an immediate update of the description displayed on the screen.

VIII. GENERAL INFORMATION

A. PRINTED CIRCUIT BOARDS ARE DESIGNATED AS FOLLOWS:

- A1 Logic Board Assy.
- A2 Interface Assy.
- A3 Power Supply Assy.
- A6 Sound/Speech Assy.

B. WIRE COLORS ARE SHOWN AS NUMBERS:

0 Black	5 Green
1 Brown	6 Blue
2 Red	7 Purple
3 Orange	8 Slate
4 Yellow	9 White

For example, 688 is a BLUE- SLATE-SLATE striped wire.

C. FUSES

BOTTOM PANEL

F1	Primary Power	4-Amp SLO-BLO
F2	6.3 VAC	3-Amp SLO-BLO
F3	Monitor	2 Amp SLO-BLO

POWER SUPPLY ASSY. (A3)

F11	+5VDC Source	5 Amp SLO-BLO
F21	Sound/Speech Assy. +30VDC	1½ Amp SLO-BLO
F31	Sound/Speech Assy. +12VDC	¼ Amp
F32	Sound/Speech Assy. -12VDC	¼ Amp
F41	Coin Meter +20VDC	1 Amp SLO-BLO

POWER SUPPLY SPECIFICATIONS

LOCATION	VOLTAGE	PROTECTION
Logic Board Assy.	+5VDC	Voltage adjustable. 6Amps over-voltage protection and fused for over-current protection.
Sound/Speech Board	+30VDC	1.5Amps fused for over-current protection. The reference for this circuit is a 1N5363 + 30VDC Zener controlling the base of an emitter follower pass transistor.
Sound/Speech Board	+12VDC -12VDC	100 milliamps fused for over-current protection. The plus and minus 12 volts supplies are the 7812 and 7912 IC regulators respectively.
Coin Meter	+20VDC	Full wave rectified unfiltered voltage, fused for over-current protection.
Coin Chute Lights	+4.5VDC	Full wave rectified unfiltered voltage, fused for over-current protection.
Monitor and Marquee	100VAC or 1115VAC, 60HZ	Isolated, fused AC voltage.

IX. THEORY OF OPERATION

INTRODUCTION

The character based graphics system designated GG-II has two main subdivisions. The first subdivision is the Central Processor Unit (CPU) which has three partitions:

- a. Microprocessors
- b. Memory
- c. Input and Output ports (I/O)

The Intel 8088 microprocessor is used and 32K bytes of memory is reserved for programming space and has 5 input ports and 5 output ports. The second subdivision is the video state machine which generates and controls the video signal to the monitor. The state machine has three partitions:

- a. System Clock (CLK)
- b. Foreground generator (FGND)
- c. Background generator (BGND)

The system clock is driven by a 20MHZ crystal, divided down for a 5MHZ dot clock.

All inputs and outputs including the video control and general purpose I/O are memory-mapped, (i.e. everything within the system can be addressed in a single segment of 64K addresses as memory).

The video control unit is divided into an "object-oriented" foreground driver and "character-oriented"

background driver. The screen resolution is 256 pixels horizontally, and 240 lines vertically for both foreground and background. The CPU communicates with the foreground driver and background driver by writing data into the designated memory areas in a certain format. The foreground is designed to display moving objects on the screen with a minimum overhead to the processor. The game programs will only have to specify the vertical and horizontal position and the object select number to the foreground driver. The background video supplements the foreground with relatively static figures on the screen. The CPU specifies all the character positions on the screen with desired "character" patterns.

A 5MHZ system clock drives a 9 bit horizontal dot counter and an 8 bit vertical line counter. The horizontal counter counts from 0 to 255 during active scan line and 256 to 317 during horizontal blanking time. When the horizontal counter reaches 317, the horizontal counter resets to 0. At the beginning of the horizontal blanking time (horizontal counter = 256) it increments the vertical counter. The vertical counter counts from 0 to 239 during active vertical scan time and 240 to 255 during vertical blanking time.
